Problem Solving Session

End keyword

In Python, the `end` keyword is used in the `print()` statement to specify what should be printed at the end of the output.

By default, `print()` statement moves the cursor to the next line after printing. Using the `end` keyword, we can print the outputs on a single line.

Example:

PYTHON

```
N = 3

for i in range(N):
    print("* ", end="")
```

Output:

```
* * *
```

We can a specify character or string with which the output will end using `end` keyword.

PYTHON

```
N = 3

for i in range(N):
    print("* ", end="abc")
```

Output:

```
* abc* abc* abc
```

As we can see, `*` is printed with `abc` at the end of each iteration, all on the same line.

print() statement

By default, each time you call `print()` , it takes the cursor to a new line, which means the next time you print something, it will start on a new line.

The `print()` statement without any value indicates the next output should be printed in the next line.

Example:

Code:

PYTHON

```
N = int(input())

for i in range(N):
    for i in range(N):
        print("*", end=" ")
    print()
```

Output:

```
* * *
* * *
* * *
```

Solution Explanation

- The outer loop iterates `N` times, and the inner loop also iterates `N` times.
- In the inner loop, we print a star (`*`) with a space as a separator between stars in the same line as we are using `end=" "` keyword.
- After printing `N` stars in the inner loop, the inner loop terminates, and `print()` is executed and the cursor moves to the next line.
- The outer loop iterates `N` times and creates a square pattern with stars.
