Cheat Sheet

Relational Operators

Relational Operators are used to compare values.
Gives `True` or `False` as the result of a comparison.

These are different relational operators

Operator	Name
>	Is greater than
<	Is less than
==	Is equal to
<=	Is less than or equal to
>=	Is greater than or equal to
!=	Is not equal to

Code

PYTHON

```python
print(5 < 10)
print(2 > 1)
```

Output

```
True
True
```

Possible Mistakes

Mistake - 1

Code

```python
print(3 = 3)
```

Output

```
SyntaxError: expression cannot contain assignment, perhaps you meant "=="?
```

Mistake - 2

Code

```python
print(2 < = 3)
```

Output

```
SyntaxError: invalid syntax
```

Space between relational operators `==` , `>=` , `<=` , `!=` is not valid in Python.

Comparing Numbers

Code

```python
print(2 <= 3)
print(2.53 >= 2.55)
```

Output

```
True
False
```

Comparing Integers and Floats

Code

```python
print(12 == 12.0)
print(12 == 12.1)
```

Output

```
True
False
```

Comparing Strings

Code

```python
print("ABC" == "ABC")
print("CBA" != "ABC")
```

Output

```
True
True
```

Case Sensitive

Code

```python
print("ABC" == "abc")
```

Output

```
False
```

Python is case sensitive.
It means `X` (Capital letter) and `x` (small letter) are not the same in Python.

Strings and Equality Operator

Code

PYTHON

```python
print(True == "True")
print(123 == "123")
print(1.1 == "1.1")
```

Output

```
False
False
False
```
